Claim 12; Fig 11A-JJ; 87pp; English.

The present sequence represents the human musashi promoter, which is used in the method of the invention. The specification describes a method for separating multipotential neural progenitor cells from a method for separating multipotential neural progenitor cells from a conclusic acid encoding a fluorescent protein under control of a promoter which selectively functions in the progenitor cells, into all cell types of the mixed population, allowing only the progenitor cells to express the fluorescent protein, and identifying and separating cells that are fluorescent, where the separated cells are progenitor cells. The method is useful for isolation and purification of multipotential correctly progenitor cells, especially neural stem cells from adult brain. The isolated cells are used in both basic analyses of precursor and stem cell growth control, as well as in more applied studies of their cransplantability and engraftennt characteristics. The cells are useful in support of the structural repair of the damaged central nervous system, such as in the traumatized brain, or the contoured, traumatized or transected spinal cord.

```
number of colorectal cancer antigens. These are shown in AAI57547-AAI57619 and AAM38569-AAM38641. These can be used in the diagnosis, prevention and treatment of cancer of the colon and/or rectum. The present sequence is a colorectal cancer antigen genomic sequence. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      29903

                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                   The present invention describes a homozygosity deletion domain co-existing in the 36-position of the first chromosome short arm (1p36) in human neuroblastoma. Also described are base sequences from the 1p36 position of human neuroblastoma cell lines (NB-1 and MASS-NB-SCH-1), which are tumour suppressor genes in human neuroblastoma. The genes are tumour suppressor genes in human neuroblastoma. The genes are tumour suppressor genes, base sequence data of which are applicable as tumour markers and reagents in studying mechanism of tumour body formation, and gene diagnosis of tumours as well as in developing anti-cancer drugs. ARF97787 to ARF9782 represent PCR primers used in the exemplification of the present invention, and AAF97830 to AAF97874
                                                                                                                                                                                                                                            Human 1p36 homozygosity deletion domain from the 36-position of first chromosome short arm in human neuroblastoma cell lines, applicable e.g. in gene diagnosis of tumors as well as in developing anti-cancer drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        46314 TITATIGICICIATOTATOTATOTATITITICAGACGAAGICICACIOTIGICCCOTAGG 46255

The present invention describes a method for detecting a genetic mutation in the yes! gene for the diagnosis of a yes! mediated neuropsychiatric disorder in a human. The method comprises detecting the presence or absence of a genetic mutation in the yes! gene of the presence or absence of a genetic mutation in the yes! gene of the calletion and results in the production of a bys! protein having an amino acid sequence other than the wild type yes! amino acid sequence and the presence of the genetic mutation identifies a subject that has or is at risk for developing a yes! mediated neuropsychiatric disorder. Compounds that bind to the yes! gene product, are useful for treating a yes! mediated neuropsychiatric disorder. The disorders include Huntington's disease, and especially bipolar-affected disorder. (BAD) also known as bipolar mood disorder (BP) or manic-depressive
                                                                                                                                                                                                                                                                                                                                                                               45658
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      schizophrenia;

The method distinguishes neuropsychiatric disorders from neurological disorders, which enables more accurate evaluation and prescription of medical treatment. The present sequence represents human yesl cDNA sequence.

proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, from the organism of interest. They can be used in diagnostics, biodrensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides the protein and coding sequences of novel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents HKNG1 (Hong Kong new gene 1). HKNG1 is a gene associated with bipolar affective disorder (BAD). HKGNI polynucleotides are useful to identify compounds modulating HKNG1 gene expression or HKNG1 polypeptide expression/activity. Compounds inhibiting or enhancing HKNG1 gene expression or activity in individuals can then be administered therapeutically to treat HKNG1-mediated disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                especially neuropsychiatric disorders e.g. BAD, schizophrenia, or HKNGI-mediated myopia disorders, such as early-onset autosomal dominant myopia. The polynucleotides can be used in gene therapy techniques to treat such disorders. They are also useful in diagnosis to identify individuals having, or at risk of developing, HKNGI-mediated disorders due to mutations in the HKNGI gene. Such mutations especially

result in the production of a protein with a different sequence to the human full-length HKNG1 polypeptide or splice variant sequences, especially the substitution of a lysine for a glutamic acid at residue 202 or 184. The polynucleotides are also useful in gene mapping, to produce probes or primers to identify similar sequences (e.g. mutants or sequences from different species) and to produce transgenic

This is the human SHOX gene sequence containing the PARI region. The gene region corresponding to short stature has been identified as a region of approximately 500 kb in the PARI region of the x and Y chromosomes. Three genes in this region have been identified as a chromosome. Three genes in this region have been identified as candidates for the shoxt stature gene. These genes were designated SHOX (also referred to as SHOX93 or HOX93), PET92 and SHOT (SHOX-11ke homeobox gene on chromosome three). The SHOX gene has two separate splicing sites resulting in two variations SHOXa and SHOXb. The specification provides sequences of SHOX (short stature homeobox-containing) genes SHOX shoxb, SHOX and exons of the SHOX genes as shown in AAV35610 to AAV3561 and protein sequences of the human growth protein transcription factor SHOXa, SHOXb and SHOT as shown AAW60573. The novel genes are responsible for human growth. Defects in the genes can cause short stature, e.g. Turner's syndrome. The products can be used to develop agents for the treatment of short stature or other human growth disorders. The products can also be used for providing a mitogenic effect or cells, e.g. for the treatment of bonc diseases such as osteoprosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and diseases involved with disturbance in the bone calcium regulation.

thuman secreted proteins AAB75506 - AAB75554 are encoded by polynucleotide sequences AAF64176 - AAB76424. The specification includes amino acid sequences AAB75555 - AAB750606 which represent fragments of the human secreted proteins, and protein sequences with which they share homology. The proteins and polynucleotides, their agonists and antagonists have activities dependent on the itssues and cells in which they are expressed, examples of these activities include, inwinosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; cy asotropt; cerebroprotective; notropic; neuroprotective; antibacterial; virucide; fungicide; opthalmalogical; and vulnerary. The proteins, virucide; fungicide; opthalmalogical; and vulnerary. The proteins, virucide; dispasses and disorders including, autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders cordiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, angiogenesis, nervous system disorders e.g. Alzheimer's disease, can encebral infection. The polypeptides can also be used to aid wound hading and epithalial cell proliferation, to prevent skin ageing due to sunburn, to maintain organs before transplantation, for supporting cell collucase or decrease storage capabilities included in the invention are polypeptides can also be used as a food additive or preservative to prive used in the isolation, identification and characterisation of the proteins of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents the retinoblastoma binding protein-7 (RBP-7) genomic sequence of the invention. The RBP-7 coding sequence and progulatory sequences are useful for the recombinant production of the protein and for expressing heterologous nucleic acids. Primers and probes derived from the RBP-7 nucleotide sequence (e.g. AAZ87035-287099) are useful for DNA amplification and detection methods. RBP-7 biallelic markers (see AAZ86993-287034) are useful for diagnosis of disease related to alteration in the regulation or in the coding regions of the RBP-7 gene and for prognosis/diagnosis of an eventual treatment with therapeutic agents, especially agents acting on pathologies involving abnormal cell proliferation and/or differentiation, these include thyroid hyperplasta, psoriasis, benign prostate hypertrophy, cancers, including presst cancer, sarcomes and other neopleans, pages and cancer, and the concert of the concert of the concert of the cancer of the concert of
Novel nucleic acid and polymorphic markers used for diagnosis of diseases, especially those involving abnormal cell proliferation and differentiation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               lung cancer, prostate cancer, various leukaemias, and

This is a preliminary nucleotide sequence of the SHOX gene. The gene region corresponding to short stature has been identified as a region of approximately 500 kb in the PARI region of the X and Y chromosomes.

Three genes in this region have been identified as candidates for the short stature gene. These genes were designated SHOX (also referred to as SHOX93 or HOX93), per92 and SHOT (SHOX-1ike homeobox gene on chromosome three). The SHOX gene has two separate splicing sites canculting in two variations SHOXa and SHOXb. The specification provides sequences of SHOX (short stature homeobox-containing) genes SHOX F192, SHOXa, SHOXb, SHOY and exons of the SHOX genes as shown in AAV35610 to AAV35621 and protein sequences of the human growth protein transcription factor SHOXa, SHOXb and SHOY as shown AAW60573. The novel genes are responsible for human growth. Defects in the genes can cause short stature, e.g. Turner's syndrome. The products can be used to develop agents for the treatment of short stature or other human growth disorders. The products can also be used for providing a mitogenic effect on cells, e.g. for the treatment of bone diseases such as osteoporosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        10931 TGGACTGCAGTGGCACTATCTCGCCTCCCTGCAACCTCCACCTCCCAGATTCAAGCAATT 10872

(AAIGS911-AAIG373) and the encoded polypeptides (AAM42417-AAM42691) collectively known as kidney antigens and the use of such kidney antigens for detecting disorders of the kidney, especially kidney cancer and kidney cancer metastases. The polynucleotides and proteins are also useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, assertointestinal tract, liver, lung, or urogenital; (b) immune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      polypeptides, useful for diagnosing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  invention relates to novel kidney related polynucleotides

                                                                                                                                                                                                 exon
                                                                                                                                                                                                                                                           exon
                                                                                                                                                                                                                                                                                       exon
                                                                                                                                                                                                                              exon
                                                                                                                                                                                                                                                                                                                     exon
```

```
This sequence represents the genomic DNA sequence encoding human prostate carcinoma tumour antigen-1 (PCTA-1). At least three PCTA-1 DNAA MAAN 10226, AAAN 10228, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        for determining genetic predisposition to prostate cancer, for diagnosis of this cancer and for the prognosis/detection of an eventual treatment response to therapeutic agents against prostate cancer. They can be used to design of drug screening protocols to provide accurate and efficient exclusion of therapeutic and side-effect potential of new or already existing medicaments, as well as for screening molecules which modulate or inhibit the expression of the PCTA-1 gene, preferably those active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotide used to develop products for detecting susceptibility to, diagnosis, prognosis and therapy of prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 366.6; DB 21; Length 106746; Pred. (AAI63971-AAI6393) and the encoded polypeptides (AAM42417-AAM42691) collectively known as kidney antigens and the use of such kidney antigens for detecting disorders of the kidney, especially kidney cancer and kidney cancer metastases. The polyuclectides and proteins are also useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cencer, and other cancers of the adrenal gland, bone, bone marrow, breast,

invention relates to novel kidney related polynucleotides

(b) immune disorders

gastrointestinal tract, liver, lung, or urogenital; (b) immune disorde e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. crebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

parasitic infections.

GST-4 gene is found on chromosome 16q33.1. GST is a type 2 membrane protein useful for inhibiting a binding event
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GST is a type 1 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular agent that inhibits the sulphation activity of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes, glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious anaemia, demyelinating diseases, cirrhosis, ulcerative colitis, segmeratis, ragional enteritis, adult respiratory distress syndrome, infantile eczema, posciasis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2; Mismatches 991; Indels 204; Gaps

```
The invention relates to nucleic acids from human chromosome 2p21-16.3 and the encoded peptide (and mouse and chicken orthologues) that comprises a PGECCPLP group, an insulin-like growth factor binding protein (IGFBP)-11ke domain, cysteine-rich domains, an RGD (undefined) group and a transmembrane domain. The protein, e.g. CRIMI, interacts with peptides of the transforming growth factor superfamily. A composition comprising an expression construct comprising the nucleic acids of the invention or a mimetic which antagonises or mimics an activity of a CRIMI polypeptide may be used in a method for modulating the biological activity of a polypeptide of the bone morphogenic protein (BMP) family. In this way they may be used to prevent or treat an eye disease, contract formation. They may also be used to treat an eye disease, neurodegenerative diseases, renal and kidney disease, bone and tooth abnormalities, wounds and skin damage, e.g. by use of the nucleic acid in gene therapy by using antibodies directed against CRIMI polypeptides. The CRIMI gene.
                                                                                                                                                                                                                        Nucleic acids from human chromosome 2p21-16.3 and the encoded peptide, useful for preventing, diagnosing and treating e.g. eye disease, especially cataract formation -
                                                                                                                                              ï

The sequence is not exact but it is believed to be the best representation of this region. The region was sized by PCR from clone DNA at 650 bp. The region corresponds to restriction digest hindii: band size 7685 in silico and 7756 real.
                                                                                                                                                                 Submitted (15-JUL-2000) Genome Sequencing Center, Washington University School of Medicine, 4444 Forest Park Parkway, St. Louis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Clone CTA-350L10 is from a release of the human BAC library CITB-HS-A. The library contains cloned DNA from human sperm. See: Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); U-J. Kim et al., Genomics 34:213-8 (1996). The clone is available from NECTOR: pBeloBAC11
                                                    Louis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOTICE: This sequence may not represent the entire insert of this colone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NEIGHBORING SEQUENCE INFORMATION:
Actual start of this clone is at base position 1 of CTA-350L10;
actual end is at base position 230552 of CTA-350L10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence was finished as follows unless otherwise noted:

The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this Sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7, send mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This clone was derived from human PAC library RPCI-4, prepared by petere de Jong and coworkers at the Roswell Park Cancer Institute (http://pacpac.med.bufafalo.edu) using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from
                                                                                                                                                                                                    USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The clone may be obtained either from Genome Systems, Inc. (http://www.genomesystems.com) or Research Genetics, Inc. (http://www.genomesystems.com) or from Pieter de Jong. VECTOR: pryPAC2

NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP5-1186P10. Actual start of this clone is at base position 1 of RP4-771P4; actual end is at 131359 of RP4-771P4.
                                                                                                                                              Direct Submission
